Yes, Kobe Bryant Faked his Death by Miles Mathis

The Mechanics of Narrative Control and Misdirection

When investigating events of this magnitude, it is necessary to first understand how the truth is obscured through the use of intentional misdirection. On platforms like YouTube, content that suggests Kobe Bryant is still alive is often allowed to remain active, but only when it is designed to look foolish. For instance, theories suggesting he is now playing basketball under a different identity are promoted specifically to blackwash the entire concept of a staged death. By presenting the public with a ludicrous theory that is easily debunked at a glance, the organizers ensure that the general population will dismiss any legitimate skepticism as equally absurd. In this way, the truth is protected by a layer of manufactured stupidity that prevents the average person from looking deeper into the actual anomalies. It is highly likely that such misdirection is funded or approved by the individuals involved to ensure their actual exit remains unexamined by the masses.

The Legal Impossibility of the Missing Black Box

A central pillar of the official story is the claim that the helicopter involved had no black box or flight data recorder, which supposedly made the investigation difficult for the National Transportation Safety Board. This claim, however, is a physical and regulatory impossibility. Aviation regulations have mandated flight recorders on all commercial aircraft, including helicopters, since 1967. The Sikorsky was a commercial vehicle operated by Island Express. If a company were operating high-end commercial helicopters without this mandatory equipment in 2020, they would have been shut down by the Federal Aviation Administration immediately. The fact that the company was not shut down proves the black box existed, and the narrative of its absence is a convenient fiction used to mirror other historical events where data was conveniently lost. These devices are built to withstand extreme impacts and temperatures, meaning their absence in the official report is a clear indicator of a scripted narrative.

Contradictory Air Traffic and Radar Reports

The official reports regarding the conditions of the flight are riddled with logical contradictions that cannot be reconciled by any pilot or logician. The media claimed that Los Angeles Police Department helicopters and most other air traffic were grounded that morning due to heavy fog. Simultaneously, the same report claims the pilot was circling because of heavy air traffic in the area. It is impossible to have heavy air traffic when the majority of flights are grounded. Furthermore, the control tower reportedly told the pilot he was flying too low to be tracked by radar. If the helicopter was truly off the radar and lacked a black box, it is impossible for the authorities to know the exact altitude, the southern turn toward the mountains, the precise speed of 161 knots, or the climb rate. The existence of this data in the Hollywood Reporter and other mainstream outlets proves that the story was written in advance rather than being based on recovered flight evidence.

Navigational Anomalies and Dangerous Flight Paths

The reported flight path of the helicopter is geographically nonsensical for a trip from Santa Ana to Camarillo. A direct route for such a trip would never require flying over Glendale or Burbank. To take that heading, the pilot would have had to fly significantly out of his way to put a large Sikorsky directly over the skyscrapers of downtown Los Angeles in heavy fog. No professional pilot would risk flying near the Wilshire Grand or the USBank Tower in poor visibility when a more direct and safer route was available. Additionally, the pilot was reported to be flying at 1,200 feet in an area where the surrounding terrain reaches 3,300 feet. This is a suicidal altitude for a helicopter in heavy

fog, and since the aircraft was equipped with its own altimeters, the pilot would have been fully aware of this danger. This suggests that the flight path and the weather conditions were fabricated as part of a disappearing act.

Evidence of Weather and Visual Discrepancies

There is significant reason to believe that the reported weather conditions were part of a standard toolkit used in staged events to prevent public scrutiny. Similar claims of extreme weather were used in the Titanic fraud and the more recent events in Maui and Pacific Palisades to explain away anomalies or prevent people from seeing the actual scene. Visual analysis of the crash site further confirms these suspicions. The debris shown in photographs does not appear to belong to a Sikorsky helicopter, likely because the organizers did not want to destroy a multimillion-dollar aircraft for a fake event. Furthermore, while the impact supposedly started a brush fire, the photographs show no scorched earth or significant fire damage in the surrounding vegetation. Instead, only a small, localized puff of smoke is visible, which does not align with a high-speed, high-fuel impact.

Persistence of Identity in Public Records

Data from public search engines reveals that the individuals involved in this event still appear in databases as living people. Ara Zobayan, the pilot, is listed as a living 55 or 56 year old residing in Huntington Beach on sites like Radaris and Instantcheckmate. He was supposedly 50 at the time of the crash, yet these databases continue to update his age and list him as alive. There are no obituaries or listings for him on sites dedicated to the deceased, such as Findagrave. Similar anomalies exist for Gianna Bryant, who appears in verified listings in Florida. These listings show her with no age or relatives, which is a common trait of protected or relocated identities. Verified listings for a Kobe Bryant in Fort Myers, Florida, also exist, and while the ages may vary, the presence of these records suggests a relocation rather than a tragedy.

Predictive Programming and Scripted Signals

The event shows signs of having been planned for at least eight years before it occurred. A Twitter account named .Noso accurately predicted that Kobe Bryant would die in a helicopter crash as early as 2012. Given the account's name and its use of Bryant's image, it is likely that Bryant himself was the one behind the account, signaling his eventual exit strategy. Further predictive evidence was found in a 2018 cartoon that depicted a similar scenario. Even the religious details surrounding his final day, such as receiving the Eucharist hours before the flight, serve as narrative signals. This level of symbolic detail is common in staged retirements where the individual wishes to leave the public eye with a clean and heroic legacy.

A Motive for Seclusion and Privacy

The most logical explanation for these anomalies is that Kobe Bryant wished to retire in absolute peace and chose a secluded location to live out his life with his daughter. The media's constant focus on the two of them as a duo, reinforced by monuments and statues, provided the perfect narrative cover for them to disappear together. By staging a joint departure, Bryant was able to secure full privacy and escape the constant demands of fame. The focus on the father-daughter relationship in the aftermath of the event was a scripted tool to facilitate their joint exit into a private life, away from the scrutiny of the public world.
